

App to recover deleted videos from sd card

Continue

Can you recover deleted videos from sd card.

By Shea Laverty All files, including pictures, can be deleted from an SD card in two ways: by using File Explorer to manually delete files or by formatting the card to erase everything on it. Each option may be better suited to different situations, especially depending on your personal security concerns. Both can be performed without downloading any extra software. Most SD cards come with a write-protection switch, which prevents files from being deleted or added to the card. Check the card and make sure the switch is set to the Unlock position before trying to delete files from your card. Deleting from File ExplorerYour SD card can be managed through File Explorer just like any other connected drive or file folder and with many of the same options. Deleting files using File Explorer is the quickest and easiest method, but it may leave some data behind which can be used by recovery experts to restore the file. This is only a concern if you are planning to give away or sell the card in the near future and need to make sure that all files are permanently deleted. SD Card reader portSD-to-USB adapter Insert your SD card into your computer's SD card reader port. If your computer doesn't have an SD card port, insert the card into a SD-to-USB adapter and connect the adapter to one of your computer's USB ports. i Image courtesy of Microsoft. Press Windows-X and select File Explorer from the Power User menu if you're using Windows 8. i Image courtesy of Microsoft. For Windows 7 users, click Start followed by Computer. i Image courtesy of Microsoft. Double-click the SD card in the Devices and Drives menu. i Image courtesy of Microsoft. Right-click the image you want to delete and select Delete. Unlike files saved on your main hard drive, deleting files from your SD card doesn't send them to the Recycle Bin, but deletes them outright. Be sure you don't want to keep the picture before you click Delete. Formatting Your SD CardIf you're going to give away or sell your SD card or want a more secure erasure of the card's contents, formatting is a better solution. Formatting completely erases and overwrites all data, making it much harder to recover even for a data recovery professional. However, it can be a bit more time consuming depending on the options you select. Most digital camera manufacturers recommend formatting your SD card in-camera to optimize compatibility. As format operations vary from one camera to the next, consult your owner's documentation for formatting instructions specific to your camera. While formatting with Windows is often fine, the SD Association recommends using its proprietary SD Formatter tool to format SD cards. Free downloads of both SD Formatter and its user guide are available. i Image courtesy of Microsoft. Right-click on your SD card in File Explorer and select Format. i Image courtesy of Microsoft. Select FAT32 from the File System drop-down menu if it isn't selected by default and un-check the Quick Format check box. Click Start to begin formatting. Allow the computer some time to complete the formatting procedure. If you're just using the format option to delete everything on the card at once, using the Quick Format option is fine. This method is quicker than fully formatting the card, but isn't as thorough about overwriting the data. If security is a concern, always use the full-format option. Removing the CardWhen you're done, properly eject the SD card to finalize any data-writing procedures. Failure to do so may result in data corruption. i Image courtesy of Microsoft. Right-click the SD card in File Explorer and select Eject. Wait for the pop-up declaring it's safe to remove the card and then remove it from the card reader or USB adapter. i Image courtesy of Microsoft. Alternatively, click the ^ arrow in the system tray and find the Safely Remove Hardware and Eject Media icon. Right-click the icon and select Eject SD Card. Wait for the pop-up message declaring it's safe to remove the card. By Diana Prince i typing hands image by Tom Davison from Fotolia.com An SD, or secure digital, card is a specific memory card format that a variety of portable devices—including digital cameras, PDAs and mobile phones—utilize. In order to retrieve data saved on an SD card, you must learn how to open the card on your computer. Once you open the card, you can copy files for transferring or editing purposes. You need to perform only a few steps to open an SD card, either with a USB reader or without one. Insert the SD card into the SD slot on the USB reader. Insert the opposite end into a USB port on your computer. Click on the desired option when a pop-up menu appears on the screen. Options include "Open folder to view files," "View pictures" and "Import pictures and videos," if not more. Each of these opens the SD card for you to view saved data. Locate the SD slot on the computer. On a desktop computer, you will generally find the slot in the front of the tower; on a notebook, look on the side. Insert SD card directly into SD slot on your computer. Click on the desired option when a pop-up menu appears on the screen. Options include "Open folder to view files," "View pictures" and "Import pictures and videos," if not more. Each of these options opens the SD card for you to view saved data. By Robert Kingsley A SanDisk SD card is a small memory card that can be used for extra storage in many portable media devices. It is quite common for digital cameras and video cameras to save their data to these cards. They can hold a lot of data, some up to 64 GB, and they're easy to use. Reading these cards requires the use of an SD card reader. Most computers have one installed internally, but external readers are available for systems that do not. Remove your SanDisk SD card from your video device. Plug the card into your SD card reader. If the reader is external, you will need to plug its cable into a free USB port on your computer. Windows will recognize the card automatically. Click "Start" from your Windows desktop and click "Computer." The SD card will be listed as a drive on your system. Double-click the SD card to view its contents. It may be listed as "Removable Disk." Locate the video you want to view and double-click the file. Your default media player will launch and play the video. Smartphones are giving us more and more storage space with every new generation of devices. Unfortunately, apps are becoming increasingly demanding, requiring more space to be housed on our phones. At the same time, smartphone cameras are growing more powerful, making the photos we capture with them bigger and bigger. Luckily, many phone manufacturers have offered us a way out of this predicament: SD cards. Depending on the Android smartphone you own, you'll find a slot for an SD or microSD card on its side. By using this slot, you'll be able to house not only files but also apps. Accordingly, this article explains how to move apps to an SD card in Android. It also covers how to use an external SD card as additional internal storage. Looking for a microSD card? Check out our article on the best microSD cards available right now. How to move apps to an SD card in Android First of all, make sure you've actually inserted your SD or microSD card into your Android's slot. This can be done by using a pin or needle to pop out the card tray, which you should find on the side of your phone (some phones allow you to insert the card directly into the slot, without pulling out a tray). Make sure you place the card the correct way up on the slot, with the label facing up. You'll then be given a prompt to format the card when inserting it for the first time. Assuming your SD card has been properly inserted, you can move apps to it by doing the following: Step 1: Go to Settings > Apps & Notifications > App Info/See All Apps. Step 2: Tap the app you'd like to move to your SD card and then tap Storage (this might be displayed as Storage and Cache on some phones). Step 3: Tap Change, which you'll see under the Storage Used heading. If you don't see this option, it's not possible to move this particular app to an SD card. Step 4: Select your SD card from the options available, and then tap Move. That's it. However, if you want to move the app back to your phone's internal storage, simply go through the process above, except choose Internal storage during Step 4. How to use an SD card as internal storage in Android With certain Android smartphones, you may not be able to move apps to an SD card, even if your phone does have such a card. Fortunately, some Androids let you use your SD card as if it were part of their internal storage, via a process known as Adoptable or Flex Storage. This includes devices manufactured by Huawei, Motorola, and HTC, but not those made by Samsung and LG. To set up your SD card as part of your phone's internal storage, go to Settings > Storage > [Your SD Card]. Once you've selected your SD card, tap More (it looks like three vertically aligned dots) and then tap Storage Settings. Lastly, tap Format as Internal. This option requires you to erase all of the pre-existing contents of your SD card, so if you already have important files on it, you may need to transfer them first or refrain from formatting it altogether. Also, you will need a pretty good microSD card if you want to use it as internal storage for your phone. That means you'll need an Ultra High Speed (UHS) SD card, preferably one that's UHS-3 rather than UHS-1. Editors' Recommendations By Kevin Smith Many cameras use SD media cards to save images. If you are having trouble deleting pictures from your SD card, it is likely that your SD card reading device is incompatible with your SD card or that your SD card is locked. Check to see if your SD card is locked. If the slider on the left side of the card is in the "locked" position, you will not be able to delete photos. Move the slider away from the "locked" position to be able to delete the pictures. If you took the pictures on your SD card on one camera, but are using another camera to delete them, you will likely not be able to delete anything. Most cameras only allow you to delete pictures made on that particular model. Return the SD card to the original camera to delete the files. If you are having trouble deleting pictures from an SD card through your computer, your SD card reader may be outdated. Refer to the SD card reader manual and take note of the maximum SD speed. If you are attempting to delete pictures from a class 6 SD card with a class 4 SD reader, deletion will not be possible. Find an SD reader that is compatible with your SD card.
